

Intelligent Crop Marketing Assistant (Market Agent + Decision Agent)

Problem Statement:

Many farmers sell their produce without access to real-time market intelligence, leading to lower profits. Develop an **Agentic AI Crop Marketing Assistant** using IBM watsonx and IBM Cloud, where a **Market Agent** collects current crop prices, demand trends, and nearby market information, and a **Decision Agent** analyzes transportation costs, expected price movements, and government support schemes to recommend the optimal market, selling time, and pricing strategy. The system should help farmers maximize profitability by providing transparent, data-driven marketing decisions.
